1. Interpretations will always be different depending on who made it but having a discussion with one's current employer to confirm that their interpretation does meet the users requirements should help confirm that there are no issues.

2. A. Lane assist: I think the waterfall model would be a good basis for the development of this system. Most roads are all built the same so there shouldn't be any change that would force more development on the system.

B. Virtual Reality CDL training: Incremental might be the best basis for this system because when you are able to give demonstrations the trainers might want to change something about the system. And since incremental is good at accommodating change it would help greatly.

C. Replacing School Registration: Integration and Confirmation would be the best basis as trying to start from scratch wouldn't help the school system any. And trying to have similar or the same components would help the school adjust to the change.

D. Disney Planning: I think Incremental would be the best basis for this as there are many users who would use this system so allowing the ability of change during development would help its creation.

3. I think the automation will have the same consequences. I don't think it is ethical to fully resist the introduction of it. I do think the technology will bring with it a lot of change and I believe a lot of that change will be good impact for the future.

4. Netflix: Level 1. Initial. Must assume everyone starts here
Level 2. Managed. Has a person or group that takes charge to confirm everything goes as it should.
Level 3. Defined. Has a technical team that handles what could go wrong with their service
Level 4. Quantitatively Managed. Has a crew that is always checking performance of their service. They also compare the numbers from previous performance checks.
Level 5. Optimizing. I feel Netflix is lacking on this level. I don't think they are improving their system currently just throwing more and more onto it and hoping it continues to work

5. I think a process is required no matter the number of people in a group. I do believe that the group should all agree with the tasks that need to be done and who is doing what tasks and that the work is being divided evenly in the group.
